

Bond3D has developed a revolutionary printing technique to produce parts made from high performance polymers through additive manufacturing. The products have the same characteristics as products that are currently produced with conventional techniques. Since the foundation in 2014, Bond3D has been developing the 3D printer to put the innovative concepts into practice. The new generation of printers that are currently being developed can print the parts quickly, in high quality and reproducibly.

Does High Tech appeal to you? And an environment in which multidisciplinary insight is self-evident? Do you seize such a technical challenge with both hands and do you want to work with your colleagues to develop concepts for this? Take your chance now and get started with Bond3D and make an important contribution to the development of this revolutionary printer.

Quartermaster serviceorganisation

Bond3D is building up a strong global brand and corresponding professional organisation. By the end of 2021, Bond3D should be ready to be able to export their printers. It is very important that the productivity of this printer is optimal. Simple preventive or corrective maintenance can be dealt with by the customer. More complex preventive and corrective service actions will be carried out by Bond3D, either remotely or on-site. We need to plan shipment and service in the most professional way possible. This implies we need to make a few preparations:

- Which service actions can be dealt with remotely and how can we adapt the software to facilitate this?
- How do we prepare factory acceptance, shipment, site acceptance, spare parts and required tooling?
- Which preventive and corrective service actions are typically needed, with which interval?
- Which operator and service actions can be carried out by the customer, and how do we prepare training and documentation?
- How do we setup a service manual and other documentation, such as an SLA?
- How do we set up a tiered global service organisation for the long term?

Bond3D is looking for a seasoned quartermaster who can take responsibility to prepare and organise these activities on an interim basis. Being a young and evolving company, a hands-on mentality is required. The candidate must enjoy pioneering and be able to find his or her way in the company, and deliver a sound service organisation and framework. Experience in a global service organisation of professional high tech OEM is expected.

Does the above appeal to you? Then send your motivation letter and CV via recruitment@bond3d.com
